Health Consultation: A Note of Explanation

An ATSDR health consultation is a verbal or written response from ATSDR to a specific request for information about health risks related to a specific site, a chemical release, or the presence of hazardous material. In order to prevent or mitigate exposures, a consultation may lead to specific actions, such as restricting use of or replacing water supplies; intensifying environmental sampling; restricting site access; or removing the contaminated material.

In addition, consultations may recommend additional public health actions, such as conducting health surveillance activities to evaluate exposure or trends in adverse health outcomes; conducting biological indicators of exposure studies to assess exposure; and providing health education for health care providers and community members. This concludes the health consultation process for this site, unless additional information is obtained by ATSDR which, in the Agency’s opinion, indicates a need to revise or append the conclusions previously issued.

PUBLIC HEALTH EVALUATION

OF THE

505 SOUTH MAIN STREET PROPERTY

NEW BRITAIN, HARTFORD COUNTY, CONNECTICUT

Prepared By:

The Connecticut Department of Public Health
Under cooperative agreement with the
The Agency for Toxic Substances and Disease Registry
BACKGROUND AND STATEMENT OF ISSUE

The United States Department of Health and Human Services (US DHHS) received a letter from a resident of New Britain, CT on April 3, 2007 that expressed concerns about the site located at 505 South Main Street in New Britain, CT. The concerns were related to the potential exposure of the neighboring community and future students to site-related contaminants at the planned Alternative Behavior Center for grades 6th –12th. The letter was assigned to the Agency for Toxic Substances and Disease Registry (ATSDR), accepted as a petition, and forwarded to the Connecticut Department of Public Health (CTDPH) for follow-up. The goal of this health consultation is to evaluate public health issues regarding the 505 South Main Street site.

The 505 S. Main Street site is approximately 1.13 acres and is located on the west side of South Main Street, north of Willow Brook Park, in the City of New Britain. A map of the site is found in Appendix A. The City of New Britain’s Assessor’s office, Map 3014, shows that the site comprises Lot 22 and is currently owned by The Consolidated School District of New Britain. Insurance records showed that a residence occupied the site in 1909. The property was also used as a construction material and storage yard from until recently to at least the 1950’s. The site was also used previously by Maroni Oil to park oil trucks.

An environmental contractor completed a Phase I Environmental Site Assessment (ESA) for the former property owner, Ashley Realty, LLC, of the 505 South Main Street site on October 25, 2005 (Maguire 2005). Another contractor released a Phase II ESA prepared for the Consolidated School District of New Britain on February 28, 2006 for the 505 South Main Street site (JGI Eastern 2006). Groundwater and surface soil samples were taken as part of the Phase II ESA for a variety of volatile organic compounds (VOCs), total petroleum hydrocarbons (TPH), polychlorinated hydrocarbons (PCBs), and a small number of heavy metals. All of these soil sample concentrations were found to be below state cleanup standards. Both reports also indicated open containers of suspected petroleum product onsite and recommended that the containers be removed and disposed of as soon as possible.

The United States Environmental Protection Agency (U.S. EPA) responded to a letter they received from the same resident in June 2007 by evaluating environmental data from the property and concluding that the soil and groundwater samples are below state standards. In addition, a response dated September 2007 by the U.S. DHHS concluded that soil and drinking water were not a public health concern for the site. However, the letter did indicate a concern over whether the open containers of petroleum have been
removed from the site and whether construction activities are addressing the possible existence of localized contamination. The letter also stated that CTDPH would follow up on these issues. In response, a site visit on November 19, 2007 was conducted by CTDPH and ATSDR to evaluate current site conditions. During the site visit, ATSDR and CTDPH staff observed two fifty-five gallon drums probably filled with petroleum on the property. Because of the health risk of exposure to the contents of the drums, CTDPH then facilitated the removal of these drums with the New Britain Health Department (NBHD) in January 2008.

The school construction activities will be completed in February of 2008. The site is about 300 meters from a high school.

Site Visit

ATSDR and CTDPH staff conducted a site visit at the 505 South Main Street site on November 19, 2007. The site consists of the following: 1) a nearly completed school building, 2) construction equipment, 3) paved driveway, 4) and a roll-off disposal container. Construction activities were occurring during the site visit. A chain link fence bounds the site on the north, east, and western sides. The southern side is unfenced and contains the driveway. The entire site was walked and there was no evidence of visible soil staining. The soil on the non-paved areas of the property appeared to be clean topsoil with areas of grass seeding. Two large piles of soil (one appeared to be soil, the other consisted of gray colored fine powder) were observed on the southwestern corner. Adjacent to the soil pile was a collection of construction materials (metal structures lying flat on the surface of the soil). Two fifty-five gallon drums were identified along the southeastern portion of the site. One construction worker, who was asked about these drums, stated that the site manager is working with an environmental testing company (Clean Harbors) to characterize the drum contents. The worker stated that the drums would be removed. The removal date was not stated. The worker also stated that the drums appear to contain a liquid - which he hypothesized was petroleum.

Throughout the site a few areas of trespasser debris (or possibly construction worker debris) were observed including: food wrappers, cigarette packages, and drink containers. The site is about 300 meters from a large building that was identified by the worker as a high school.

Environmental Contamination and Health Comparison Values

The Phase II ESA describes results of surface soil and groundwater samples obtained from the site. Ten surface soil samples obtained from site were analyzed for a variety of VOCs, TPHs, a small number of metals, and PCBs. The Connecticut Department of Environmental Protection (CT DEP), CTDPH, and the U.S. EPA reviewed the sampling results and did not identify any public health concerns. Although, a few heavy metals (lead, chromium, and barium) and TPHs were detected in the surface soil samples, all concentrations were below Connecticut cleanup standards. PCB and VOC levels in surface soil were below detectable limits.
The community surrounding the site is served by a municipal water system. Community members are not exposed to site-related chemicals in their drinking water supply.

As stated earlier, both the Phase I and Phase II ESA reports noted that open containers of petroleum product were observed onsite. The Phase II report recommended that the containers be removed and properly disposed of as soon as possible. The report concluded that some localized contaminated soil could exist on the site even though widespread contamination was not detected in the soil samples. It was recommended that future development activities take into account the potential for localized soil contamination.

DISCUSSION

Exposure Pathway Analysis

The only past potential pathway was exposure to the suspected petroleum in drums onsite. These were potential exposure pathways dependent on the drums leaking their contents and exposing trespassers or workers. In addition, site access is not restricted; there is no fence surrounding the property. Trespassers or workers coming into contact with the drums could have been exposed by touching the contents of the drums (dermal) or by breathing vapor from the contents of the drums (inhalation).

Because the drums have been removed as of January 2008, there are no current potential pathways onsite.

Public Health Implications for Adults and Children

When determining the public health implications of exposure to hazardous contaminants, CTDPH only evaluates exposures that are complete pathways.

The liquid contained in the drums has not been characterized, but has been hypothesized to be petroleum. The public health implications of either dermal or inhalational exposures to the constituents in the drums are varied and could include: CNS depression, acute respiratory distress (asphyxiation), increased risk of developing cancer, or skin lesions. Since the constituents may also include combustible VOCs, there exists the potential for the liquid to burn or explode. The health implications of such an event could include severe burns or even death due to a catastrophic explosion of a drum. During the November 2007 site visit, CT DPH staff learned from contractors that the drums would be removed at a future date, but the date was unknown.
CONCLUSIONS

In response to a petition to ASTDR, CT DPH conducted a site visit to follow up on the petitioner’s concerns about the site located at 505 South Main Street in New Britain, CT. The concerns were related to potential exposure to site related contaminants by neighboring community and future students at the planned Alternative Behavior Center.

During the Phase I and Phase II investigation, surface soil and groundwater samples were taken and the results of the sampling were not found to be a public health concern. However, two fifty-five gallon drums, partially filled with suspected petroleum product, were found on the site during a recent site visit and could harm the health of trespassers or construction workers. CTDPH then facilitated the removal of the drums with the NBHD in January 2008.

As requested CTDPH evaluated whether exposures exist from contamination present on the 505 S. Main St. property site. Under past site conditions, CTDPH concludes that people’s health could have been harmed if they were in contact with suspected petroleum product from the drums located on the site. Under current site conditions, CTDPH concludes that we do not expect people’s health to be harmed from the drums onsite because they have been removed.\(^1\)

RECOMMENDATIONS

1. We have no recommendations for the site at this time.

PUBLIC HEALTH PLAN

Actions Taken

1. CTDPH wrote a letter to the facilities director of the property notifying him that ASTDR had received a letter from a resident who had concerns about the site. CTDPH also stated that they would be doing a site visit on November 19, 2007.

2. CTDPH and ATSDR did a site visit on November 19, 2007 and observed two fifty-five gallon drums on the site.

3. CTDPH contacted the NBHD to notify them of the two drums and asked for their assistance in facilitating the removal of the drums.

4. The two drums were removed by a waste disposal company in early January 2008.

\(^1\) ATSDR has a categorization scheme whereby the level of public health hazard at a site is assigned to one of five conclusion categories (Appendix B). CTDPH has concluded that the site poses no public health hazard under the current conditions.
Actions Planned

1. CTDPH will continue to work with ASTDR and NBHD to respond to health questions and concerns involving this site.

2. CTDPH will continue to evaluate environmental data from the site if it is generated in the future.

3. CTDPH will provide a copy of the health consultation to the petitioner.

CERTIFICATION

The Health Consultation for the Public Health Evaluation of 505 S. Main Street Property, New Britain, Connecticut was prepared by the Connecticut Department of Public Health under a cooperative agreement with the Agency for Toxic Substances and Disease Registry (ATSDR). It was completed in accordance with approved methodology and procedures existing at the time the health consultation was initiated. Editorial review was completed by the ATSDR Cooperative Agreement Program.

Alan Crawford  
Technical Project Officer  
Division of Health Assessment and Consultation (DHAC)  
Agency for Toxic Substances and Disease Registry (ATSDR)

The Division of Health Assessment and Consultation (DHAC), ATSDR, has reviewed this health consultation and concurs with its findings.
