7. REGULATIONS AND ADVISORIES

Because of its potential to cause adverse health effects in exposed people, various international, national, and state agencies regulate HCCPD as a toxic or hazardous substance and have established standards, guidelines, and advisories for its manufacture, use, and disposal. Some of the major regulations regarding HCCPD in air, water, and other media are summarized in Table 7-1.

An inhalation MRL of 0.01 ppm for intermediate-duration exposure was calculated based on a LOAEL of 0.2 ppm from a 14-week study by Rand et al. (1982b) that examined structural changes in the Clara cells of the lung epithelium in rats exposed to HCCPD. The critical effect was the appearance of electron-lucent granules in the Clara cells of the exposed animals.

A chronic-duration inhalation MRL of 0.2 ppb was calculated from a LOAEL of 0.01 ppm for the formation of yellowish-brown pigmentation of the nasal/tracheal and/or bronchial epithelium of male and female rats in the study by NTP (1994).

The EPA has calculated a chronic oral Reference Dose (RfD) of 0.007 mg/kg/day for HCCPD. Hyperplasia and focal inflammation of the forestomach were the critical effects (IRIS 1997). The EPA has not determined a reference concentration (RfC) for chronic inhalation exposures using HCCPD (IRIS 1997).

ATSDR has calculated an oral MRL for intermediate-duration exposures of 0.1 mg/kg/day using the same study and end point used in the derivation of the EPA RfD (Abdo et al. 1984).

The EPA has determined that HCCPD is not classifiable as to its human carcinogenicity because there is inadequate supporting data from human studies and no data from animal studies. Therefore, HCCPD has been assigned to cancer group D (IRIS 1997). The American Conference of Governmental Industrial Hygienists (ACGIH) also finds HCCPD to be “not classifiable as a human carcinogen.” ACGIH has assigned HCCPD to the cancer category A4, which indicates that there is cause for concern about its carcinogenicity but a conclusive assessment cannot be made from the available data (ACGIH 1998). The National Toxicology Program (NTP) of the U.S. Department of Health and Human Services and the
7. REGULATIONS AND ADVISORIES

International Agency for Research on Cancer (IARC) have not evaluated HCCPD for human carcinogenicity.

To protect workers against the adverse health effects that could result from exposure to chemicals, the Occupational Safety and Health Administration (OSHA) has promulgated permissible exposure limits (PELs) for more than 400 hazardous or toxic substances commonly found in the workplace (OSHA 1989). An employer must ensure that an employee’s exposure to an OSHA-regulated substance in any 8-hour work shift of a 40-hour week does not exceed an 8-hour time-weighted average (TWA) determined for the substance (OSHA 1974). On January 18, 1989, OSHA promulgated a final rule that provided more protective PELs for approximately 376 toxic substances (OSHA 1989). Of the 428 substances considered in the rule, 164 substances, including HCCPD, had not been previously regulated by OSHA (OSHA 1989). The primary basis for setting a new limit for HCCPD was to avoid sensory irritations (e.g., eye irritation and intolerable odor) that had been associated with exposures to the substance (OSHA 1989). OSHA established an 8-hour TWA limit of 0.01 ppm for HCCPD. The new PEL was 10 times lower than the level associated with systemic damage and pulmonary irritation in animal exposure studies (OSHA 1989). Although OSHA set the new PEL so that employee risks of intense eye and pulmonary irritation and multiple organ damage would be reduced, all limits set in the 1989 promulgation were revoked in July 1992 by the 11th Circuit Court of Appeals (OSHA 1993). On March 23, 1993, OSHA resumed enforcing the air contaminant exposure limits that were in effect prior to the issuance of the new limits in 1989 (i.e., OSHA 1974 PELs). The Agency later published in the June 30, 1993, Federal Register a final rule announcing the revocation of the 1989 exposure limits (OSHA 1993). Because OSHA had not established a PEL for HCCPD prior to the 1989 promulgation, there is no current PEL for HCCPD. However, the National Institute for Occupational Safety and Health (NIOSH) and approximately 25 states have adopted the 0.01 ppm (0.1 mg/m$^3$) exposure limit for HCCPD set by OSHA in 1989 (NIOSH 1992, 1997; OSHA 1993). ACGIH also adopted the 0.01 ppm (0.1 mg/m$^3$) exposure limit for HCCPD (ACGIH 1998).

HCCPD has been designated as a hazardous substance pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980 (EPA 1995a) and as an extremely hazardous substance under Section 313 of Title III of the Superfund Amendments and Reauthorization Act (SARA) of 1986 (EPA 1996f). The statutory sources for designating HCCPD as a CERCLA hazardous waste are sections 31 l(b)(4) and 307(a) of the Clean Water Act (CWA) and section 3001 of the Resource Conservation and Recovery Act (RCRA) (EPA 1995a). The owners and operators of facilities that have HCCPD on their sites are required to immediately report releases of HCCPD to any environmental media,
if the amount released exceeds the established “reportable quantity” of 10 pounds (4.54 kg) (EPA 1995a). Title III of SARA is also known as the Emergency Planning and Community Right-to-Know Act (EPCRA) of 1986. As a chemical subject to the emergency planning and release reporting requirements of EPCRA, owners and operators of certain facilities that have HCCPD on their sites in amounts exceeding the “threshold planning quantity” of 100 pounds must develop a program that addresses implementing emergency response plans and notifying the public of accidental releases (EPA1996c, 1996f).
