

4. CHEMICAL, PHYSICAL, AND RADIOLOGICAL INFORMATION

4.1 CHEMICAL IDENTITY

Information regarding the chemical identity of plutonium and selected plutonium compounds is located in Table 4-1.

4.2 PHYSICAL, CHEMICAL, AND RADIOLOGICAL PROPERTIES

Information regarding the physical and chemical properties of plutonium and selected plutonium compounds is located in Table 4-2. Information regarding the radiological properties of selected plutonium isotopes is located in Table 4-3. The decay schemes for ^{239}Pu and ^{241}Pu are summarized in Figures 4-1 and 4-2, respectively.

Plutonium is a member of the actinide series and is a human-made element (atomic number 94). Actinides are the 15 elements starting with actinium, atomic number 89, and extending to lawrencium, atomic number 103. All of the isotopes of the actinide elements are radioactive. Plutonium was the first human-made element to be synthesized in weighable amounts. ^{238}Pu was discovered in 1940 by Seaborg and co-workers; it was synthesized by the bombardment of uranium with deuterons (^2H). Isotopes with mass numbers 228–247 have been identified for plutonium; all are radioactive. The most important isotope is ^{239}Pu , which has a half-life that is sufficiently long (24,100 years) to permit its preparation in large amounts, making it possible to perform chemical studies. Metallic plutonium exists in six allotropic modifications under ordinary pressure; a seventh phase exists under high pressure. Five oxidation states, Pu(III), Pu(IV), Pu(V), Pu(VI), and Pu(VII), are known to exist in compounds and solution (Clark et al. 2006). Plutonium(III) and plutonium(IV) are considered to be the reduced forms of plutonium, while plutonium(V) and plutonium(VI) are the oxidized forms (DOE 1987a). While the atomic mass of plutonium depends on the isotope, 244 is frequently listed as the mass of plutonium on periodic tables. ^{244}Pu is the isotope with the longest half-life.
